

Home Maintenance Platform - Project Task Organization

Home Maintenance Platform (**HomeHero**) is developed as a **full-stack project**, where the **entire team shares the same vision and goal**. To manage development efficiently, we **divide large tasks into smaller, manageable components** such as **frontend, backend, database, and integration**.

Since we only just finished our database milestone, we cannot share full details of personal tasks inside this project, however there are few important notes we made.

- **Task Management:** We use **Jira** as our primary platform for task tracking, sprint planning, and issue resolution.
- **Task Division:** Each member focuses on specific components while aligning with the project's overall objectives.
- **Collaboration:** Daily or weekly meetings are held to discuss progress, share feedback, and solve challenges collaboratively.
- **File Storage:** All files, documents, and source code are stored in the cloud to ensure seamless remote collaboration among team members. This organizational approach ensures accountability, transparency, and teamwork throughout the project lifecycle.
